- Abstract** *Background:* The purpose of this study was to determine the prevalence of self-reported mental health problems in a community sample of young adults. *Methods:* A cross-sectional survey of 1,000 young adults (18–24 years) was conducted. The survey included a validated self-report measure of mental health problems. *Results:* The prevalence of self-reported mental health problems was 12.5%. The most common self-reported mental health problems were anxiety (10.5%), depression (8.5%), and stress (7.5%). *Conclusions:* The prevalence of self-reported mental health problems in this community sample of young adults is relatively high. This finding highlights the need for mental health services for young adults.
